

Alfagomma introduces: Halogen Free Hydraulic Hose range

"We do not inherit the earth from our ancestors, we borrow it from our children."

Native American Proverb

A variety of environmental problems now affect our entire world. The environmental challenges facing industrial companies and governments throughout the world are numerous and complex.

In attempting to make a contribution to find an answer to these challenges, Alfagomma also in line with the latest OEM environmental requisites for a hydraulic hose not containing Chlorine, Fluorine and Iodine has replaced its standard range of hydraulic hose with an environmental friendly HF range of product.

The HF hose will be available and introduced from the beginning of 2010 and will replace the standard range.

How can the HF range be identified?

The new product can be identified by the acronym "HF" on the branding text of the hose and will have a new set of part numbers.

Which hose specifications are available in the HF range?

The HF range is available in the following hose families:

1SN, 2SN, R6, R3, 1TE, 2TE, 3TE, 2SC

What about the swaging charts?

In developing this product, Alfagomma carried out an extensive impulse test programme to validate the new range.

The result is a revised set of swaging diameters as denoted on the Alfagomma Crimping Chart 2010-03.
